This task enables the user to create a digital listing for their auditions, bringing more accessibility to finding the audition and a place to gain accurate information on interest.

The navigation model I created is a **Multilevel** model with each level having its own smaller **Stepwise** model within it, and each piece having an **Escape Hatch** back to the landing page. This is because each task has its own management setup with smaller tasks with it it to be able to be completed. While the landing page cannot directly navigate to every part of each stepwise step, every step does have an escape route back to the landing page.
